### Hair Sample Help File

Traces of certain chemicals and their metabolites originating from what an individual consumes can accumulate in the hair shaft and become trapped within the growing hair. Utilizing this fact, it is possible to track historically what a person has taken into their system by obtaining a hair sample from the individual and testing for the presence of certain chemicals. It takes about 5 days after consumption for traces of a chemical of interest to show up in the hair.

The term drug clearance refers to the time it takes for a drug to be cleared from the body after it has been consumed. After a drug has been cleared it will not show up in a drug test such as a urine, blood or saliva test.
